

ABSTRACT OF THE INVENTION

2 A net is adapted to stretch across the entire width of a garage doorway to cover a
3 vertical portion of the doorway. The net comprises an open weave web portion having a
4 closed weave border. Two brackets mounted one on each side of the doorway near the floor
5 include lugs spaced above the garage floor. Straps extend from the bottom and top portions
6 of the border toward the brackets and loop through the lugs and back onto themselves where
7 hook-and-loop fasteners secure them in place. One or more intermediate straps may extend
8 from each end of the net between the top and bottom straps to corresponding lugs. The
9 garage door freely passes in front of the net to close the doorway as normal.
